The AVR I/O ports are the path to the outside world.

Understand how to use them and life is good.

Failure to understand how the ports are used will cause grief and possibly cost \$'s.

An abused I/O port is fairly easy to burn out with excessive current or static damage.

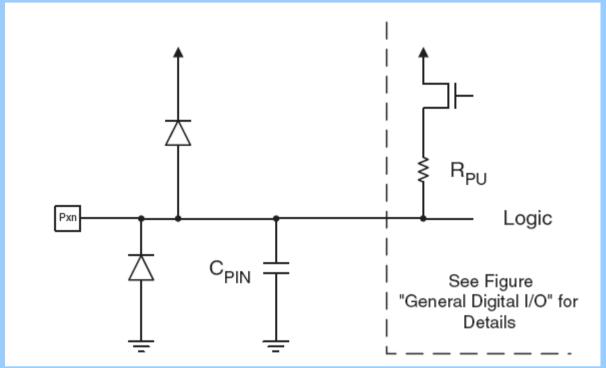

-most all the I/O ports are floating inputs that can build up large static charge

Never carry your AVR board in a non static-dissipative bag.

- -dry fall days are perfect for creating conditions for ESD damage
- -practice safe electronics, use the pink bag

Using proper port software conventions will keep code transportable, readable and more bug free. i.e.,

I/O Port input structure

- -protection diodes
- -programmable pull-up resistor
- -what happens if voltages exceeding Vcc are applied to an I/O pin?
- -can you power a chip from an I/O pin?

All ports.....

- -have bit-selectable pull-up resistors
- -have bit-selectable tri-state outputs (what are these?)
- -have schmitt trigger input buffers (what is that?) (can you draw one?)
- -are synchronized to the system clock to prevent metastability (what is that?)
- -have symmetrical DC drive capability (what does that mean?)

All ports have read-modify-write capability, i.e.,

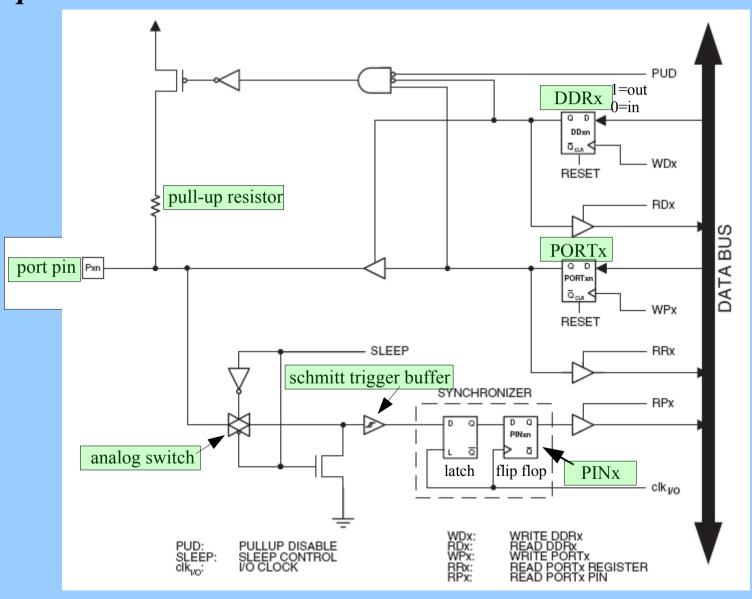

-i.e., you can change pin *direction*, pin *value*, or pin *pull-up resistor* without effecting any other pins in the port

Control of all ports and pins is done with three registers

- -DDRx (i.e., DDRB is *data direction register* port B)
- -PORTx (i.e. PORTB is the *output register* for port B)
- -PINx (i.e. PINB in the *input register* for port B)

All of these ports may be read. Writing the PINx register does nothing.

AVR port architecture

AVR I/O port usage

bit 0: output mode, logic '1' asserted, if PINB.0 is read, it returns a '1'

bit 1: output mode, logic '0' asserted, if PINB.1 is read, it returns a '0'

bit 2: input mode, no pullup resistor, if PINB2 read returns state of pin

bit 3: input mode, pullup resistor on, thus if PINB3 is read it...... returns a '0' if pin is driven '0' returns a '1' if the pin is not driven

AVR I/O port usage

DDRx selects pin direction (in or out)

PORTx determines the driven pin value if the pin is an output

determines if a pullup is present if the pin is an input

PINx holds the value of the pin

Port usage fine points

Regardless of the setting of the DDRx register, the port pin can be read from PINx Thus, an driven output value in PORTx can always be read in PINx.

When the "pull-up disable bit" in the Special Function I/O Register (SFIOR) is set, all pull-ups are disabled regardless of the setting of DDRx and PORTx. Pullups are also disabled during reset.

Input pins have a 1.5 clock cycle delay before a new value can be read -1 NOP instruction necessary to read updated pin

Use pull-ups on unused I/O pins to lower power consumption.

Using alternative functions of some port pins does not effect other pins.

AVR I/O port programming

In the file iom128.h, define statements are used to make shorthand notation for ports and bits. For example......

```
/*Data Register, Port B */
#define PORTB SFR IO8(0x18)
and also.....
/*Port B Data Register - PORTB */
#define
         PB7
#define PB6
#define PB5
                 5
#define PB4
#define PB3
#define PB2
#define PB1
#define PB0
```

AVR I/O port programming

The #defines allow us to program like this....

```
PORTB = 0x05;

DDRB = 0x0A;

OR

SPCR = (1<<SPE) | (1<<MSTR);

DDRB |= (1<<DDB2) | (1<<DDB0);

AND

temp0 = PINB;
```

Which way of setting SPCR and DDRB is better? What is the difference?

AVR I/O port programming

By using AND, OR and XOR, we can manipulate individual bits

```
//toggle bit 5
PORTB = PORTB ^{\circ} 0x20; // invert
PORTB ^= 0x20; // invert again another way
//set bits 7 and 2, don't bother others
PORTB = PORTB 0x84;
PORTB = (1 << PB7) | (1 << PB2) ; //shorter, more portable
//clear bit 0 and 1, but nothing else
PORTB = PORTB & 0xfc; //one way
PORTB &= \sim 0 \times 03; //maybe clearer
PORTB &= \sim ((1 << PB0) | (1 << PB1)); //more portable
```

AVR I/O port programming

By using a "mask" we can get the value of individual bits.

```
//looking for bit zero of port D to be a one
if(PIND & 0x01){take_some_action();}
```

The value 0x01 as used here is called a "mask". It allows us to zero out the other bits and determine if one particular bit is a one. We can look for a zero also....

```
//looking for bit 5 of port B to be a zero
if(~PIND & 0x20){take_action();}
```

Best yet is to use the avr-libc functions *bit_is_set()* and *bit_is_clear()*:

```
if (bit_is_set(PINC, PC2) {return 0;}
while (bit_is_clear(SPSR,SPIF)) {}
```

AVR I/O port programming

Assume (correctly!) that after reset, the following is true:

DDRD = 0x00

DDRB = 0x00

Assume a mega128 board has a normally open switch attached to port D bit zero. When the switch is closed, the port D bit is connected to ground.

Write code that reads port D bit zero, inverts its value and outputs that value to port B bit 0. Do not disturb the values of any other pins.

(5 minutes)

AVR I/O port programming

Assume a mega128 board has a normally open switch attached to port D bit zero. When the switch is closed, the port D bit is connected to ground.

Write code that reads port D bit zero, inverts its value and outputs that value to port B bit 0. Do not disturb the values of any other pins.

```
#include <avr/io.h>
//read port d bit 0, invert and output to port b bit 0
int main()
 while(1){
  DDRD &= 0xFE; //make port d bit zero input mode
 PORTD = 0 \times 01; //turn on bit 0 pull-up
  DDRB = 0x01; //set port b bit 0 to output mode
  if (PIND & 0x01) {PORTB &= 0xFE; }
                  {PORTB \mid = 0 \times 01;}
  else
  }//while
}//main
```

AVR I/O port DC characteristics

The Absolute Maximum Ratings are not where you want to operate an IC

Absolute Maximum Ratings*

DC Current per I/O Pin40.0 mA
DO Comment V and OND Dina 2000 and
DC Current V _{CC} and GND Pins200.0 mA

"NOTICE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Where do these ratings come from?

AVR I/O port DC output characteristics

Output Buffer characteristics (mega128 datasheet page 321)

V IH2	input night voitage	neoet pii	n'es ACC, ,	V _{CC} + 0.5	V
V _{OL}	Output Low Voltage ⁽⁸⁾ (Ports A,B,C,D, E, F, G)	$I_{OL} = 20 \text{ mA}, V_{CC} = 5V$ $I_{OL} = 10 \text{ mA}, V_{CC} = 3V$		0.7 0.5	v v

Always read the footnotes

- 2. IVIII THEGHA DE FOREST VALUE WHERE THE PILLIA GUARANTEEU TO DE LEGIS AS HIGH
- 3. Although each I/O port can sink more than the test conditions (20 mA at $V_{CC} = 5V$, 10 mA at $V_{CC} = 3V$) under steady state conditions (non-transient), the following must be observed:

TQFP and MLF Package:

- 1] The sum of all IOL, for all ports, should not exceed 400 mA.
- 2] The sum of all IOL, for ports A0 A7, G2, C3 C7 should not exceed 300 mA.
- 3] The sum of all IOL, for ports C0 C2, G0 G1, D0 D7, XTAL2 should not exceed 150 mA.
- 4] The sum of all IOL, for ports B0 B7, G3 G4, E0 E7 should not exceed 150 mA.
- 5] The sum of all IOL, for ports F0 F7, should not exceed 200 mA.
- If IOL exceeds the test condition, VOL may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test condition.
- 4. Although each I/O port can source more than the test conditions (20 mA at Vcc = 5V, 10 mA at Vcc = 3V) under steady state conditions (non-transient), the following must be observed:

TQFP and MLF Package:

- 1] The sum of all IOH, for all ports, should not exceed 400 mA.
- 2] The sum of all IOH, for ports A0 A7, G2, C3 C7 should not exceed 300 mA.
- 3] The sum of all IOH, for ports C0 C2, G0 G1, D0 D7, XTAL2 should not exceed 150 mA.
- 4] The sum of all IOH, for ports B0 B7, G3 G4, E0 E7 should not exceed 150 mA.
- 5] The sum of all IOH, for ports F0 F7, should not exceed 200 mA.
- If IOH exceeds the test condition, VOH may exceed the related specification. Pins are not guaranteed to source current greater than the listed test condition.
